LECTURE OUTLINE

- Classical Cryptography: Overview of symmetric and asymmetric cryptography
- Shor's and Grover's Algorithms: Impact of quantum algorithms on cryptography
- Introduction to Quantum Computing: Qubits, superposition, and entanglement
- The Issue(s) in Classical Cryptography: Vulnerabilities of classical systems to quantum attacks
- Post-Quantum Cryptography Approaches: Brief overview of quantum-resistant cryptographic methods
- Challenges in Post-Quantum Cryptography: Efficiency trade-offs, key sizes, and security proofs

CyBOK Mapping

The lecture maps to the following CyBOK Knowledge Areas:

- Systems Security → Cryptography
- Infrastructure Security → Applied Cryptography

CyBOK

Essam Ghadafi

SECRET-KEY CRYPTOGRAPHY

Communicating parties must share a secret key

- Requires solution to key-distribution problem
- How can Alice send a message that only Bob can read? Use Secret-Key Encryption
- How can Bob send a message that only Bob could have sent?
 Use MACs

CyBOK

Essam Ghadafi

CyBOK

Essam Ghadafi

PUBLIC-KEY CRYPTOGRAPHY

Everyone knows PK_{Bob} but only Bob knows SK_{Bob}

How is this done in practice?

Goals:

- How can Alice send a message that only Bob can read? Use Public-Key Encryption
- How can Bob send a message that only Bob could have sent? Use Digital Signatures

CyBOK

Essam Ghadafi

QUANTUM COMPUTERS

- Exploit quantum phenomena, e.g. superposition & entanglement
- Utilise different rules than classic computers, e.g. qubits
- A lot of attention and advancement in recent years
- A lot of applications: Genomic sequencing, finance, etc.
 - How do they affect used Cryptography?

PROVABLE SECURITY (CLASSIC CRYPTO)

Security Proof = Security Requirement \mathcal{R} e.g. EUF-CMA, IND-CCA

Hard Problem \mathcal{P} e.g. Factoring, DLog

A reduction from \mathcal{R} to \mathcal{P}

If attacker violates requirement \mathcal{R} , we solve problem \mathcal{P}

The Issue: Only classic attackers have been considered against ${\cal P}$

How about Quantum attackers?

Cybok

SSAM GHADAFI

CLASSIC BIT VS. QUANTUM BIT

The state of a classic bit can be either 0 or 1

The state of a quantum bit (qubit) is a complex unit vector

$$\alpha|0\rangle + \beta|1\rangle$$

where $|\alpha|^2 + |\beta|^2 = 1$ and $\alpha, \beta \in \mathbb{C}$

We can think of a classic bit as additionally requiring that $|\alpha|^2=0$ or $|\alpha|^2=1$

When measuring a qubit, it has probability $|\alpha|^2$ of being $|0\rangle$ and probability $|\beta|^2$ of being $|1\rangle$

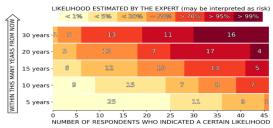

■ After the measurement, the system is in the measured state

EXPERT'S OPINIONS

In 2021, experts were asked about the likelihood of a quantum computer breaking 2048-bit RSA

[https://globalriskinstitute.org/publications/2021-quantum-threat-timeline-report]

CyBOK

Essam Ghadafi

QUANTUM ALGORITHMS

- 1994: Shor's algorithm
 - Breaks DLog & factoring with poly many gates and depth
- 1996: Grover's algorithm
 - Quadratic speed up for search problems, i.e. from $\mathcal{O}(N)$ to $\mathcal{O}(\sqrt{N})$. Applicable to exhaustive key search (brute-forcing) and hash collisions

WHY ACT Now?

Why should we care, even if large-scale quantum computers are not yet a reality?

- Quantum Threats Loom: Quantum computers will eventually break current cryptography
- SNDL (Store Now, Decrypt Later): Today's encrypted data may be stored now and decrypted in the future
- Slow Deployment: New cryptographic standards take years to be deploy at scale

Cybok

Essam Ghadafi

THE BASIC PROBLEM

Some of today's Cryptography relies mostly on *hard* problems which do not hold against quantum attackers, e.g.:

- Hardness of factoring large (e.g. 2048-bit) numbers,
 e.g. RSA encryption, RSA signatures
- Hardness of computing discrete logarithms (and related assumptions), e.g DSA, Diffie-Hellman, ElGamal

CYBOK ESSAM GHADAFI 11 CYBOK ESSAM GHADAFI

CLASSICAL HARD PROBLEMS

Factoring Problem

Input: n = p * q for some large primes p and q

Task: Factor n to find p and q

Has implications for many other assumptions, e.g. RSA, Strong RSA, etc.

Quantum hardness of factoring is poly(log n)

Discrete Logarithm (DLog) Problem

Input: Group $\mathbb{G}=\langle g \rangle$ of order p, elements g and $X=g^x$ Task: Find $x \in \mathbb{Z}_p$

Has implications for many other assumptions, e.g. CDH, DDH, q-SDH, etc.

Quantum hardness of DLog is poly(log p)

13

SHOR'S ALGORITHM & FACTORING

- Factoring ≤ Order-Finding
 - Factoring reduces to order-finding
 - An efficient algorithm to find the order of elements modulo $N \Rightarrow$ we can factor N efficiently
- Order-Finding ≈ Period-Finding
 - Order-finding and period-finding are approximately equivalent

CYBOK ESSAM GHADAFI 14

SHOR'S ALGORITHM

Steps of Shor's Algorithm:

- lacktriangle Choose a random number a
- **2** Compute gcd(a, N). If it's non-trivial, we are done
- **8** Find the period r of $f(x) = a^x \mod N$ using Quantum Fourier Transform (OFT)
 - r is the order of $a \mod N$, i.e. smallest r > 1s.t. $a^r = 1 \mod N$
- **①** Compute $\gcd(a^{\frac{r}{2}}-1,N)$ to get a non-trivial factor

This step can be efficiently computed in time $O((\log N)^2 \log \log N)$ on a quantum computer

SHOR'S ALGORITHM - EXAMPLE

Example: Factoring 21:

- Choose a = 2, compute powers: $2^x \mod 21$
- **Sequence:** $2, 4, 8, 16, 11, 1, 2, 4, 8, 16, 11, 1, \dots$ (Period r = 6)
- **Compute** $\gcd(2^{\frac{6}{2}}-1,21)=\gcd(7,21)=7$
- Factors: 3, 7, thus $21 = 3 \times 7$

Factoring is easy to solve if we can find the period r efficiently

CYBOK ESSAM GHADAFI 15 CYBOK ESSAM GHADAFI 1

GROVER'S ALGORITHM

What does it do?

- Quantum search algorithm
- Finds a marked item in an unsorted database of size N in $O(\sqrt{N})$
- Quadratic speedup over classical brute-force search ($O(\sqrt{N})$ vs. O(N)

CyBOK

Essam Ghadafi

POST-QUANTUM (PQ) SECURITY

Security Proof

PQ Security Requirement \mathcal{R} e.g. EUF-CMA-PQ

PQ Hard Problem \mathcal{P} e.g. LWE, SIS

A reduction from \mathcal{R} to \mathcal{P}

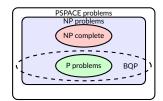

If attacker violates requirement \mathcal{R} , we solve problem \mathcal{P} .

Caters for quantum attackers

Cybok

Essam Ghadafi

Post-quantum hard problems

- Class P: Can be efficiently solved by a classical computer Example: Primality Testing, Linear Programming, etc.
- Class BQP: Can be efficiently solved by a quantum computer
 - Factoring and DLog belong to this class

Some potential post-quantum candidates:

- Solving multivariate non-linear equations over a finite field
- Bounded distance decoding over finite fields
- Finding closest & shortest lattice vectors
- Breaking cryptographic hash functions

EXISTING/PREVIOUS STANDARDS

- NIST public-key crypto standards
 - SP 800-56A: Diffie-Hellman, ECDH
 - SP 800-56B: RSA encryption
 - FIPS 186: RSA, DSA, and ECDSA signatures

All of the above can be easily broken by a large scale quantum computer

CyBOK Essam Ghadafi

POST-QUANTUM SYMMETRIC CRYPTO

A large scale quantum computer would also impact symmetric Cryptography , e.g. AES, SHA-3, but not by much

- Quantum hardness of searching \mathcal{X} is $\Theta(|\mathcal{X}|^{\frac{1}{2}})$ vs. $\mathcal{O}(|\mathcal{X}|)$ classic hardness
- Quantum hardness of finding collisions $\Theta(|\mathcal{X}|^{\frac{1}{3}})$ vs. $\mathcal{O}(|\mathcal{X}|^{\frac{1}{2}})$ classic hardness

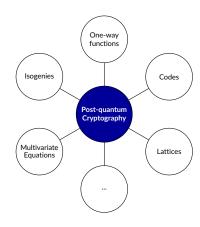

e.g. To get same security level of AES, double key size

CyBOK

Essam Ghadafi

21

PQC APPROACHES

- Various intractability assumptions
- Sometimes not easy to compare like-for-like

CyBOK

CyBOK

Essam Ghadaf

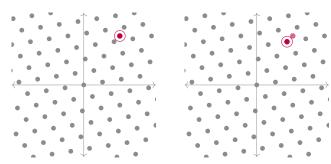

LATTICE-BASED CRYPTOGRAPHY

A lattice is a set generated by integer linear combinations of the columns of a matrix

- Key idea: Use a good reduced basis as SK and a bad basis as PK
- Enabled the first realisation of fully homomorphic encryption

LATTICE-BASED CRYPTOGRAPHY

Example: Closest Vector Problem (CVP)

Hard in high dimensions

CyBOK Essam Ghadafi 23

Essam Ghadafi

MULTIVARIATE CRYPTOGRAPHY

MQ Problem

Input: Quadratic polynomials $f_1,\ldots,f_m\in\mathbb{F}[x_1,\ldots,x_n]$ of

 $degree \leq 2$

Task: Find $\mathbf{y} \in \mathbb{F}^n$ s.t. $f_i(\mathbf{y}) = 0$ for all $i = 1, \dots, m$

♀ Intuition: Solve a system of quadratic equations over a finite field

- Even small systems are hard to solve efficiently
- Decisional MQ problem is NP-Complete
- Cryptosystems typically have large keys, but small signatures/ciphertexts (e.g., Rainbow signature scheme (Broken!))

CyBOK Essam Ghadafi

CODE-BASED CRYPTOGRAPHY

Syndrome Decoding Problem

Input: A (binary) matrix $\mathbf{A} \in \mathbb{F}_2^{n \times m}$, syndrome $\mathbf{s} \in \mathbb{F}_2^n$ Task: Find $\mathbf{e} \in \mathbb{F}_2^m$ of small Hamming weight s.t. $\mathbf{A}\mathbf{e} = \mathbf{s}$

Variation: Solve a linear system over \mathbb{F}_2 , constrained to a sparse (low-weight) solution

- Large keys (e.g., 220kB for 128-bit security in McEliece Encryption)
- Some schemes broken recently, but still practical for high security
- Modern variant: HQC (Hamming Quasi-Cyclic encryption), selected by NIST in 2025 for standardization

HASH-BASED CRYPTOGRAPHY

Used mainly for digital signatures (e.g., Lamport scheme)

- Signature schemes based on hash functions
- Security reduces to finding collisions in the hash
- Large signatures and slower signing (SPHINCS+ signature scheme standardised by NIST)

CYBOK Essam Ghadafi 26

ISOGENY-BASED CRYPTOGRAPHY

Isogeny Problem

Input: Two isogenous elliptic curves E_1, E_2 Task: Compute a map (isogeny) $\psi : E_1 \to E_2$

- Easy to verify once known, but hard to compute without the secret
- Yield compact cryptosystems
- Some schemes broken recently (SIDH/SIKE), but conceptually promising

CYBOK ESSAM GHADAFI 27 CYBOK ESSAM GHADAFI

PQC FROM SYMMETRIC-KEY CRYPTOGRAPHY

Based on classical primitives (block ciphers, hash functions, etc.) with quantum-safe parameters

Example:

- Example:
 - AES with 256-bit key (resistant to Grover's algorithm)
 - Hash-based constructions for signatures

Advantages: Efficient, simple, well-studied

NEW PQC STANDARDS

2024: Finalized NIST standards published:

- FIPS 203: Module-Lattice-Based Key-Encapsulation Mechanism (ML-KEM) CRYSTALS-KYBER
- FIPS 204: Module-Lattice-Based Digital Signature Algorithm (ML-DSA) CRYSTALS-DILITHIUM
- FIPS 205: Stateless Hash-Based Digital Signature Algorithm (SLH-DSA) SPHINCS+

NEW PQC STANDARDS

- 2016: NIST called for quantum-resistant cryptographic algorithms for new public-key cryptography standards (Digital signatures, Encryption & Key-establishment)
- 2022: NIST announced chosen candidates:
 - Encryption & Key Establishment:
 - CRYSTALS-KYBER (Lattice-based)
 - Digital Signatures:
 - CRYSTALS-DILITHIUM (Lattice-based)
 - ► FALCON (Lattice-based)
 - SPHINCS+ (Hash-based)

NIST PQC - ADDITIONAL SIGNATURES

Key Dates

- NIST issues a call for Additional Signatures published: 6 Sep, 2022
- Submission deadline: 1 Jun, 2023
- Round 1 candidates announced (40): 17 Jul, 2023
- Round 2 candidates announced (14): 24 Oct, 2024
- Deadline for updated Round 2 packages: 17 Jan, 2025

Round 2 Candidates by Approach (Total: 14)

redita = canadates by reprodeit (retail 1)				
Approach	Number			
MPC-in-the-Head (Zero-Knowledge based)	5			
Multivariate	4			
Code-based	2			
Isogeny-based	1 1			
Lattice-based	1 1			
Symmetric-based	1 1			

CyBOK Essam Ghadafi 31 CyBOK Essam Ghadafi

NIST HQC STANDARD

- HQC (Hamming Quasi Cyclic) is a code-based Key Encapsulation Mechanism
- Selected by NIST on 11 Mar, 2025 as the 5th PQC standard and backup to ML KEM
 - Provides algorithmic diversity beyond lattice assumptions
- Security relies on the Quasi Cyclic Syndrome Decoding problem
- Draft standard expected in 2026 and final standard in 2027

CYBOK ESSAM GHADAFI 3:

SOME CHALLENGES IN PQC

- Larger keys, signatures, and ciphertexts
- Higher resource demands (time, hardware, memory)
- New operations and assumptions
 - Some assumptions (e.g., SIDH) have been broken
- Side-channel attacks
- More complex implementations
 - Non-uniform sampling, sampling rejection, decryption failures, etc.

Efficiency Comparison (128-bit Security)

Scheme	Signature Size	PK Size	
RSA-3072	384	384	
ECDSA-256	64	64	
CRYSTALS-DILITHIUM	2,420	1,312	
FALCON	666	897	
SPHINCS+	17,088	32	

Sizes are in bytes

CYBOK ESSAM GHADAFI 34

KEY TAKEAWAYS

- Shor's and Grover's Algorithms threaten classical cryptosystems by efficiently solving hard problems
- Post-Quantum Cryptography aims to develop quantum-resistant cryptosystems to secure future communications
- Challenges in PQC include balancing efficiency and security, and some approaches are not as mature as their classical counterparts
